Seeds of Market-Based Capitalism: Financial Innovation and China's Modernization *with Jiachen Li*

The successful adoption of new organizational forms, such as modern financial institutions, is central to economic development. What determines their local adoption, and how do the advantages they create evolve when the policy environment changes? We study these questions in China by tracing the adoption of modern banks from the late nineteenth century to the present. Before 1936, as modern financial practices spread into China, we show using a staggered difference-in-differences design that Christian missionary arrival increased modern banks by 31% and enterprises by 27%. Newly compiled data on mission schools, publications, bankers, and elites suggest that practical education and knowledge diffusion help explain why missionaries contributed to the local adoption of modern banks. We then estimate the long-run effects of missionary exposure after 1949 using the coincidental timing of railway construction relative to national missionary inflows. The historical banking advantage weakened under central planning but re-emerged after 1978 and remains visible today. Locations with greater historical missionary exposure have higher GDP, more enterprises, and greater foreign investment, indicating that missionaries shaped the geography of China's recent growth. Evidence from elites, scientists, and historical bankers is consistent with human capital and international connections formed before 1949 surviving central planning and becoming economically relevant again after reform. Overall, the results suggest that local skills and knowledge shape the adoption of new organizational forms, while the policy environment determines when their advantages matter.
