Seeds of Market-Based Capitalism: Christian Missionaries and China's Modernization *with Jiachen Li*

How do new economic ideas spread across different institutional environments? We examine this question by tracing the adoption of modern finance in China from the late nineteenth century to the present. Before 1936, as modern financial practices spread into China, we show that Christian missionaries contributed their local adoption. Using a staggered difference-in-differences design, we find that missionary arrival increased modern banks by 31% and enterprises by 27%. Using newly compiled data on mission schools, publications, bankers, and elites, we provide evidence that practical education and knowledge diffusion facilitated adoption. We then estimate the long run effects of missionary exposure after 1949 by using the coincidental timing of railway construction relative to national missionary inflows. The historical banking advantage weakened under central planning but re-emerged after 1978 and remains visible today. Locations with greater historical missionary exposure have higher GDP, more enterprises, and greater foreign investment, indicating that missionaries shaped the geography of China's recent growth. Data on elites, scientists, and educational attainment suggest that the dissipation and re-emergence of this advantage reflect a complementarity between historically formed human capital and a policy environment supportive of market development. Overall, the successful adoption of new ideas requires both the local skills and knowledge needed to adopt them and an institutional environment in which they can be used.
