Seeds of Market-Based Capitalism: Missionaries, Banks, and China's Modernization *with Jiachen Li*

The adoption of modern financial institutions is central to economic development. As modern banks entered nineteenth-century China, Christian missionaries expanded deep into the interior and brought foreign knowledge and skills. Beyond their effects on education and development, we show that missionaries contributed to the adoption of modern banks and shaped the recent rise of market-based capitalism in China. Before 1936, we use a staggered difference-in-differences design and find that missionary arrival increased the number of modern banks by 31% and enterprises by 27%. Newly compiled data on mission schools, publications, bankers, and elites suggest that practical education and the diffusion of knowledge contributed to the transition from traditional to modern finance. In this process, traditional banks that are substitutes for modern banks decline, while those that are more complementary survive longer. We then estimate the long-run effects of missionary exposure after 1949 using variation in the timing of railway construction relative to national missionary inflows. The historical banking advantage largely disappeared under Maoist central planning and re-emerged as markets reopened after 1978. Locations with greater historical missionary exposure have higher GDP, more enterprises, and greater foreign investment, indicating broader effects on market development. Overall, the results suggest that local skills and knowledge shape the adoption of new economic institutions, while the policy environment determines when their advantages matter.
